

## **Are Your Trees being Killed by Borer Insects?**

Have you noticed several small holes in the trunks of your ash trees? If so, you probably have a borer infestation that could kill your trees. There is a product made to fight these insects. It is a systemic insecticide...most commonly made by Bayer. Since it is a systemic insecticide it will take a couple of weeks to start to work on the borers. Follow the directions on the container carefully.

Topical insecticides are probably not generally effective for treating borers since the borers have tunneled inside the tree out of reach of the insecticide.
